

Short-Day Onion Plants

- Start bulbing process when daylength reaches 10-12 hours.
- Will mature in 110 days when planted in the south during winter or early spring.
- Will mature in 75 days when planted in northern states in late spring but will not get very large; they will not reach their full size potential.
- The earlier you plant them, the larger they get.
- **Best suited for latitudes of 25-35.**

Intermediate-Day or Day Neutral Onion Plants

- Start bulbing process when daylength reaches 12-14 hours.
- Will produce nice-sized bulbs unless you live in far south Florida or south Texas.
- Will mature in 110 days when planted at the proper time.
- Exceptionally sweet.
- **Best suited for latitudes of 32-42.**

Long-Day Onion Plants

- Start bulbing process when daylength reaches 14-16 hours.
- Will do extremely well in northern states.
- Sweet, storage, and specialty long day varieties available.
- Excellent for long storage.
- **Best suited for latitudes of 37-47.**
